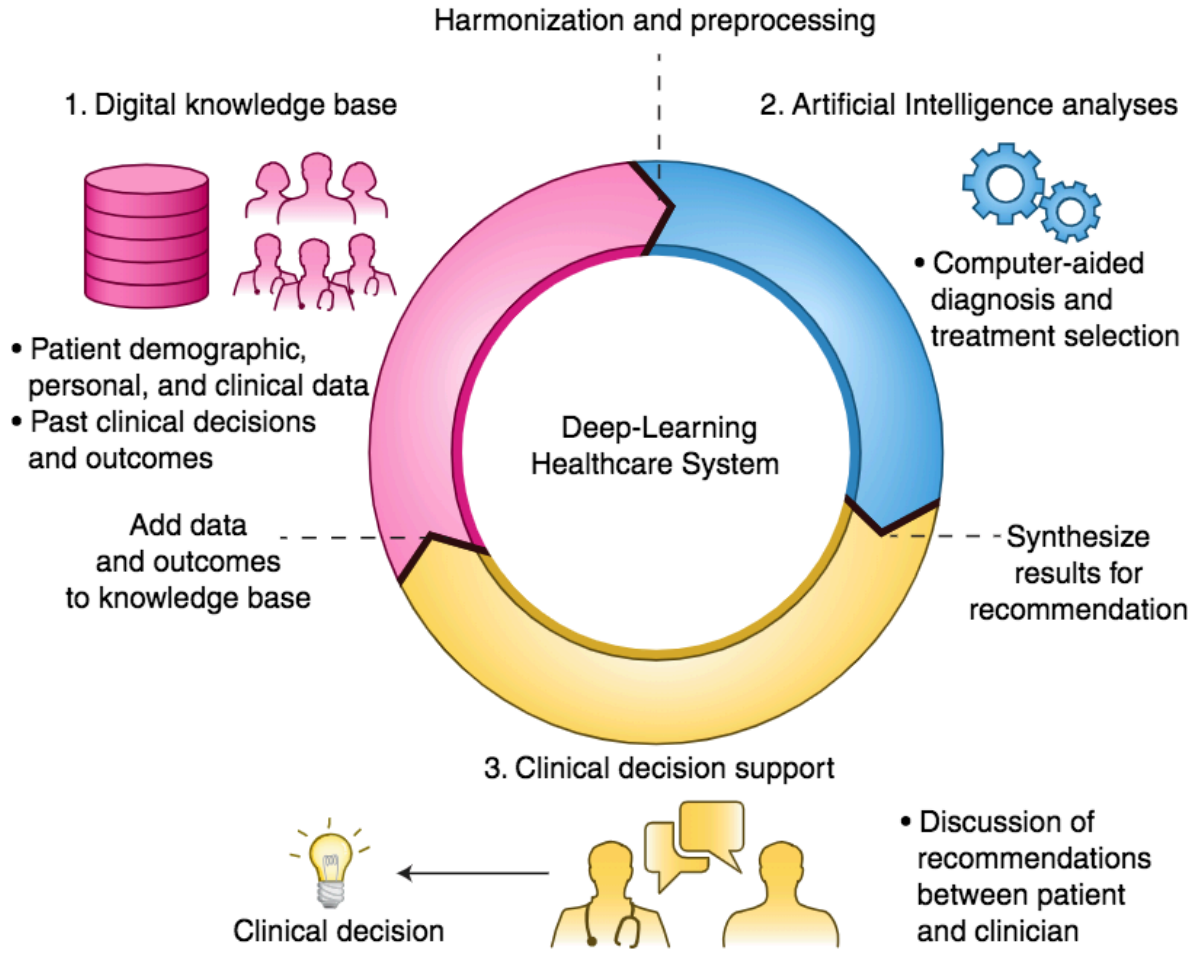

Fig. 1 | A deep-learning healthcare system. A schematic representation of a deep-learning healthcare system is shown.

Challenges of using EHR data for research

- EHRs are challenging to represent health state
  - heterogeneous
  - noisy
  - incomplete
  - structured / unstructured
  - redundant
  - subject to random errors
  - subject to systematic errors
  - *…and so and so forth*

EHR barriers to entry

- Computational

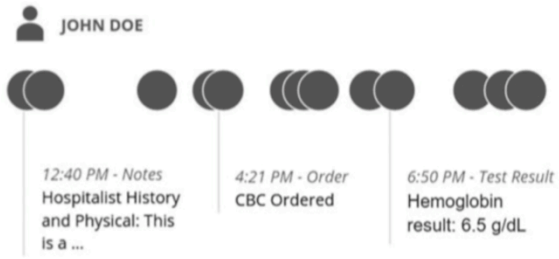
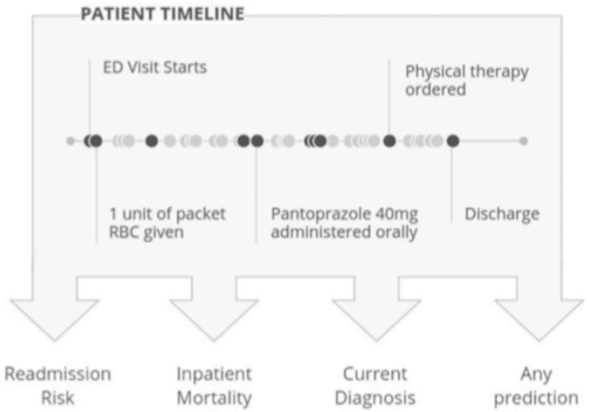
FHIR



2

All available data for each patient is converted to events recorded in containers based on the Fast Healthcare Interoperability Resource (FHIR) specification.



3

The FHIR resources are placed in temporal order, depicting all events recorded in the EHR (i.e. timeline). The deep learning model uses this full history to make each prediction.

Open-Source Software

Observational Data Management – tools and processes to standardize the structure and content of healthcare data in preparation for observational analyses, including:

- ATHENA standardized vocabularies
- Common data model and standardized vocabularies specifications
- Extract, transform, and load (ETL) design, development, and testing
- Database profiling and data quality assessment

Clinical Characterization – descriptive analyses to support disease natural history and quality improvement, including:

- Cohort definition and phenotype evaluation
- Patient record profiling
- Study feasibility assessment
- Population summarization and comparison

Population-Level Estimation – epidemiologic designs for estimating average treatment effects for medical product safety surveillance and comparative effectiveness, including:

- Comparative cohort analysis
- Self-controlled case series
- Self-controlled cohort

Patient-level prediction – machine learning methods for precision medicine and disease interception, including:

- Regularized regression
- Random forest
- k-nearest neighbors

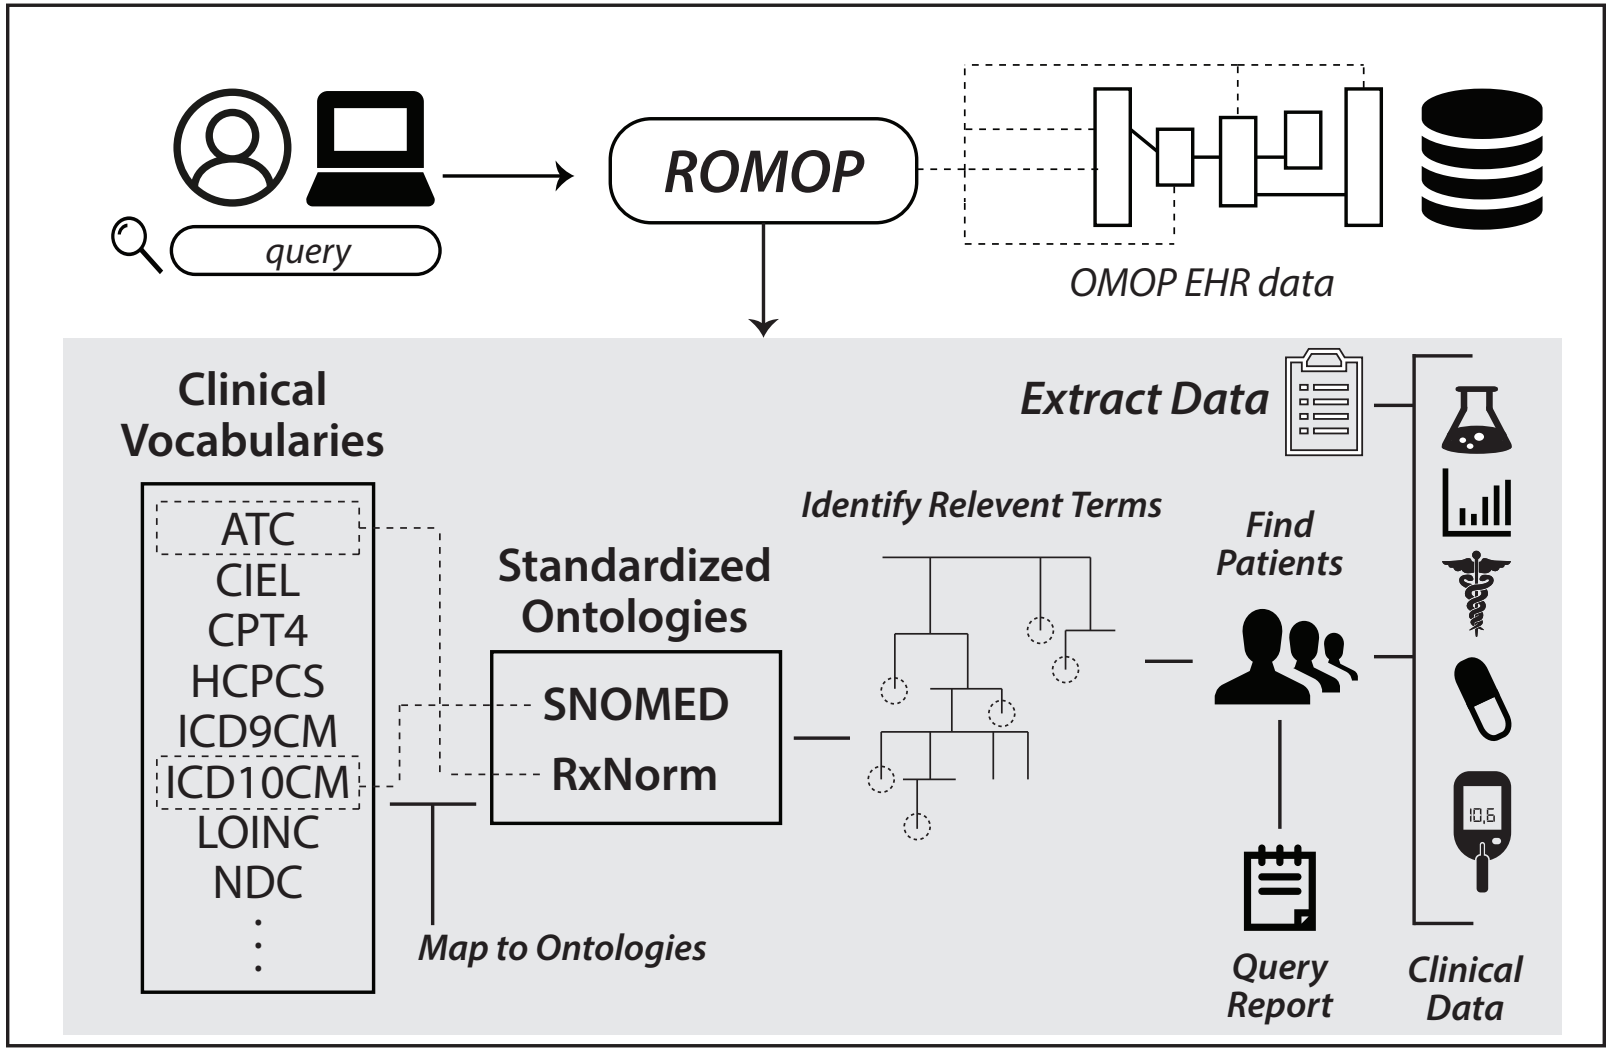
ROMOP

a light-weight R package for interfacing with OMOP-formatted Electronic Health Record data

Glicksberg et al. *JAMIA Open* (ooy059)

Goals of ROMOP

1. Automatically connect to OMOP EHR relational database
2. Enable non-technical experts to easily pull data into R-object
3. Facilitate follow-up analyses



What can ROMOP do?

1. Explore CDM fields
2. Generate population statistics
3. Search for patients:
   - Any vocabulary
   - Inclusion/Exclusion criteria
   - Flexible search strategies (e.g., and vs. or)
4. Retrieve all relevant data for patients:
   - Demographics
   - Encounters
   - Clinical
5. Automatically map concepts to ontologies
6. Export search report

Define cohorts/Find patients

ROMOP Sandbox Tutorial

Benjamin S. Glicksberg
Butte Lab
Bakar Computational Health Sciences Institute
University of California, San Francisco

2018

Start Over

Finding cohort/patients

ROMOP has a straight-forward yet flexible ways to search for patients that takes advantage of the underlying OMOP CDM structure. If the "mapped" option is selected, searching for a broad code like ATC level 3 code A05A ("Bile Therapies"), or even a specific term code like RxNorm code 1544460 for idelalisib, will automatically identify and query for all bottom-level (e.g., idelalisib 150 MG Delayed Release Oral Tablet) codes contained underneath that seed concept. This works by ROMOP first mapping the initial search criteria to a standard concept (SNOMED or RxNorm) and finding all descendants underneath it. This function allows for incorporation of multiple vocabulary types (e.g., ATC and LOINC codes) and codes simultaneously and can support both inclusion and exclusion criteria, if desired. The user can also set the strategy of dealing with criteria, namely either union (i.e., or) or intersection (i.e., and) requirements.

Find all "Type 2 Diabetes Mellitus" patients using ICD10 code (E11):

Code | Start Over | Run Code

```
1 patient_list <- findPatients(strategy_in="mapped", vocabulary_in = "ICD10CM", codes_in = "E11")
2
3
```

```
[1] "5378 patients found that meet the inclusion criteria."
```

Find all patients prescribed with any "Serotonin receptor antagonists" using ATC code (A03AE):

Code | Start Over | Run Code

```
1 patient_list <- findPatients(strategy_in="mapped", vocabulary_in = "ATC", codes_in = "A03AE")
2
3
```

```
[1] "96 patients found that meet the inclusion criteria."
```

Find all patients with "Other anxiety disorders" using ICD10 code (F31), but not prescribed with "Clonazepam" using RxNorm code (2598):

Code | Start Over | Run Code

```
1 patient_list <- findPatients(strategy_in="mapped", vocabulary_in = "ICD10CM", codes_in = "F41", strategy_out="mapped", v
2
3
```

```
[1] "268 overlapping patients excluded from the original inclusion input based on the exclusion criteria."
[1] "2057 patients found that meet the inclusion criteria."
```

Patient Finder

Identify a patient to explore: query the EMR for all patients with data a concept or concepts of interest. Can search by Diagnosis, Medication, Procedure, and Lab related concepts. Can futher filter patients by demographic features (e.g., age range, self-reported race).

Overall Report

Generate overall report of a selected patient's clinical history: this report will provide a chronological history of all events of all data modalities (e.g., diseases, medications). Can filter by event type for more focused displays.

Encounter Timeline

Interact and explore a selected patient's clinical encounter timeline: investigate clinical events by encounter. Selecting an ecnounter in the timeline will detail all associated clinical events. Can filter by encounter (e.g., Appointment) and visit (e.g., Screening) types.

Data Explorer

Explore patterns of clinical events over time: for a selected patient, can view all data measured for categorical (diseases, medications, procedures) and numeric (labs, vital signs, and flowsheet) types over time. Cateogrial variables displayed in a timeline and can be filtered for what is shown. Numeric variables are displayed as a timeseries which the user can interact with. Targeted view provides an in-depth graph of one variable at a time while the Multiplex view allows for simulaneous and linked exploration of multiple variables.

Explore Trends in Data/ Outcomes (targeted)

Data Explorer: 9000000

Data Explorer Mode:

- (●) Targeted
- ( ) Multiplex
- ( ) Multiplex Timeline

Explore all clinical events over the patient's history. The user can explore both categorical (Conditions, Medications, Procedures, or Devices) or numeric (Measurement or Observation) data. For categorical data, the events are visualized in an interactive timeline and the user can select which events to show. Further, diseases may be explored at different levels (Disease Name, ICD 9 or 10). For numeric data types, the events (e.g., WBC for Labs) are displayed as a table with # of measurements recorded. The user can select an event of interest which will display as an interactive timeseries plot.

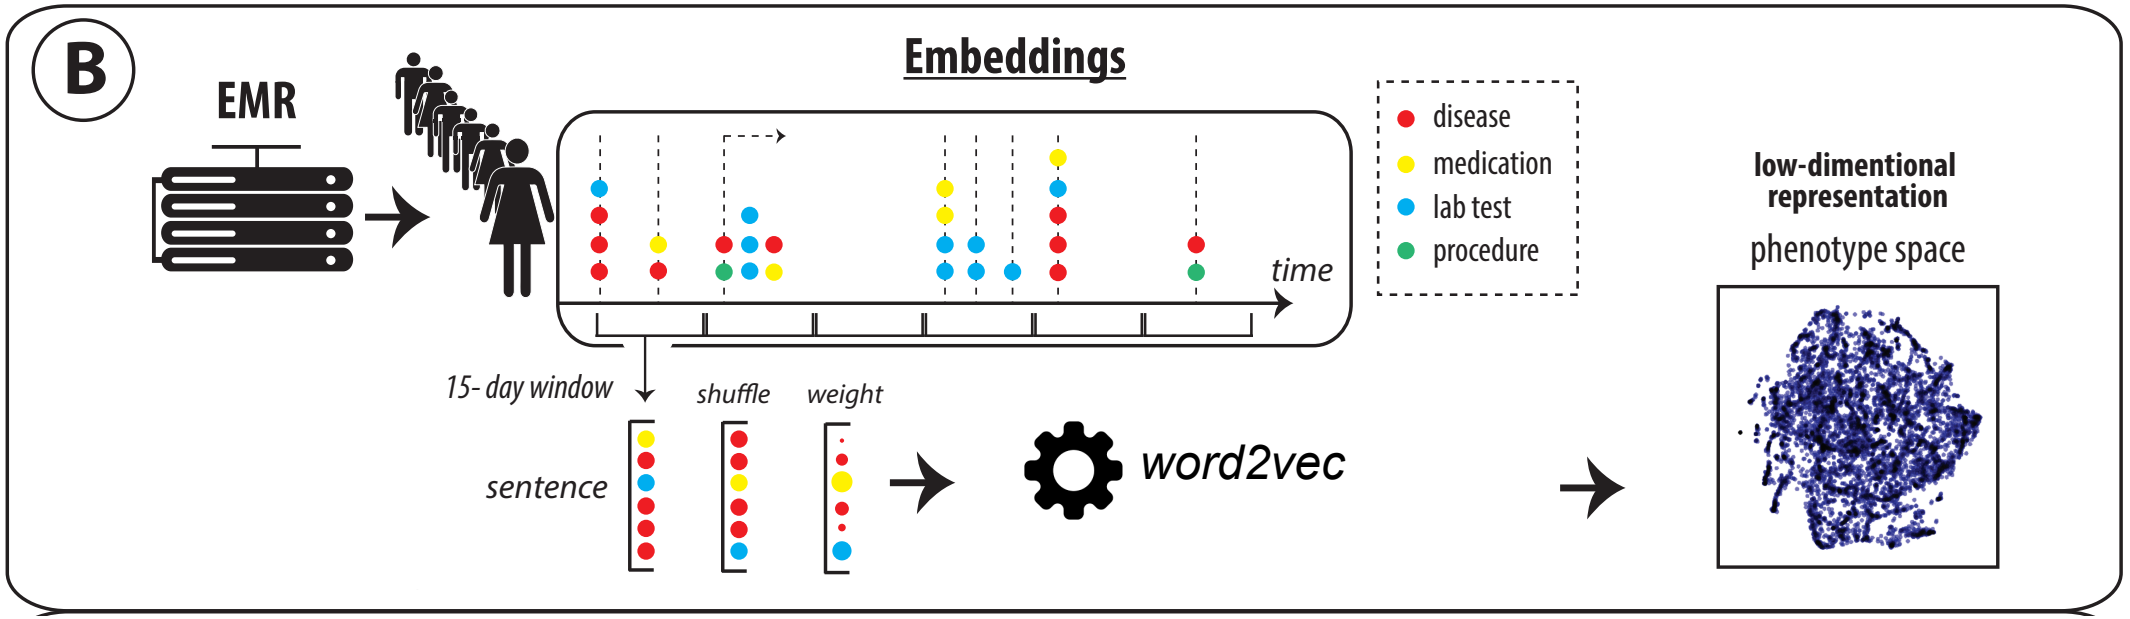
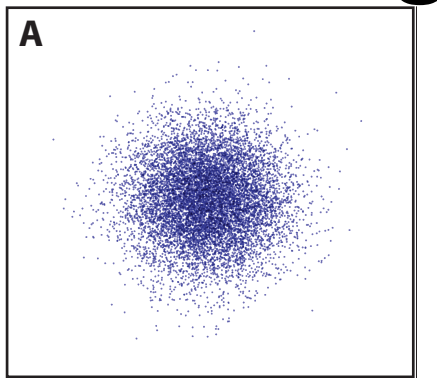
Learning phenotype embeddings



How embeddings organize the phenotype space



How well can we predict…

- Risk for disease
- Disease onset
- Symptom severity
- Treatment response
- Medication adverse events
- Ideal dose of medication
- Symptom flares
- Length of stay in hospital

Time Aggregation and Model Interpretation for Deep Multivariate Longitudinal Patient Outcome Forecasting Systems in Chronic Ambulatory Care

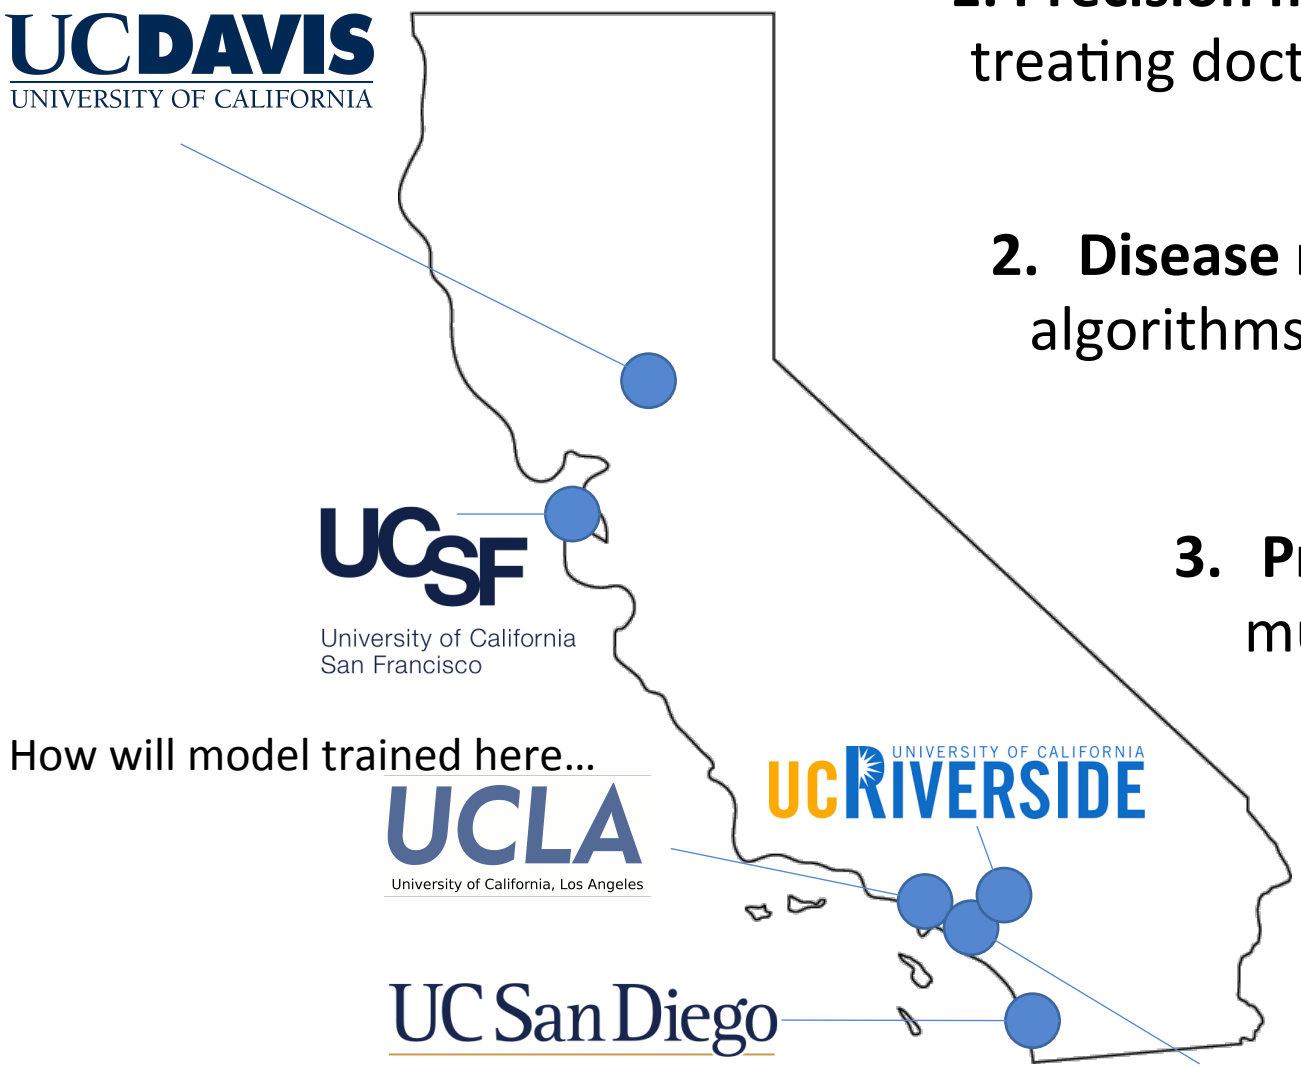
Time Windows

More representation/data = better reflection of dx



1. **Precision medicine:** finding similar patients to go beyond treating doctor's, clinic's, department's, hospital's, or even institution's expertise.

2. **Disease representation in EHR:** electronic phenotyping algorithms might not be fully generalizable. Building as a "meta" signature will be more robust

3. **Prediction:** training and testing models across multiple institutions, alone and in conjunction, will enable identifying ideal strategies

4. **Multi-omic factors:** incorporating genetics and environmental data (e.g., pollution) can help pinpoint etiology and discern GxE interactions
