Three Stages of The Journey

Where Have We Been? Where Are We Now? Where Are We Going?

Congratulations to the team of Xintong Li, Anna Ostropolets, Rupa Makadia, Azza Shaoibi, Gowtham Rao, Anthony Sena, Eugenia Martinez-Hernandez, Antonella Delmestri, Katia Verhamme, Peter Rijnbeek, Talita Duarte-Salles, Marc Suchard, Patrick Ryan, George Hripcsak, and Daniel Prieto-Alhambra for the first preprint coming out of our work on vaccine surveillance: Characterizing the incidence of adverse events of special interest for COVID-19 vaccines across eight countries: a multinational network cohort study. This preprint has been posted to MedRxiv, and community feedback is both welcomed and encouraged.

Characterizing the incidence of adverse events of special interest for COVID-19 vaccines across eight countries: a

multinational network cohort study

Abstract

As large-scale immunization programs against COVID-19 proceed around the world, safety signals will emerge that need rapid evaluation.1,2 We report population-based, age- and sexspecific background incidence rates of potential adverse events of special interest (AESI) in eight countries using thirteen databases. This multi-national network cohort study included eight electronic medical record and five administrative claims databases from Australia, France Germany, Japan, Netherlands, Spain, the United Kingdom and the United States, mapped to a common data model. People observed for at least 365 days before 1 January 2017 2019 were included. We based study outcomes on lists published by regulators: act myocardial infarction, anaphylaxis, appendicitis, Bell s palsy, deep vein thrombosis, disseminated intravascular coagulation, encephalomyelitis, Guillain-Barre syndrome. hemorrhagic and non-hemorrhagic stroke, immune thrombocytopenia, myocarditis/perica

Congratulations to the team of Seng Chan You, Harlan Krumholz, Marc Suchard, Martijn Schuemie, George Hripcsak, RuiJun Chen, Steven Shea, Jon Duke, Nicole Pratt, Christian Reich, David Madigan, Patrick Ryan, Rae Woong Park, and Sungha Park for this study published in Hypertension: Comprehensive **Comparative Effectiveness and Safety of** First-Line β-Blocker Monotherapy in **Hypertensive Patients.**

Abstract

Footnotes

Evidence for the effectiveness and safety of the third-generation β-blockers other than atenolol in hypertension remains scarce. We assessed the effectiveness and safety of β -blockers as first-line treatment for hypertension using 3 databases in the United States: 2 administrative claims databases and 1 electronic health record-based database from 2001 to 2018. In each database, comparative effectiveness of β-blockers for the risks of acute myocardial infarction, stroke, and hospitalization for heart failure was assessed, using large-scale propensity adjustment and empirical calibration. Estimates were combined across databases using random-effects meta-analyses. Overall, 118 133 and 267 891 patients initiated third-generation β-blockers (carvedilol and nebivolol) or atenolol, respectively. The pooled hazard ratios (HRs) of acute myocardial infarction, stroke, hospitalization for heart failure, and most metabolic complications were not different between the third-generation β-blockers versus atenolol after propensity score matching and empirical calibration (HR, 1.07 [95% CI, 0.74-1.55] for acute myocardial infarction; HR, 1.06 [95% CI, 0.87–1.31] for stroke; HR, 1.46 [95% CI, 0.99–2.24] for hospitalized heart failure). Third-generation β-blockers were associated with significantly higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in higher risk of stroke than ACE (angiotensin-converting enzyme) in high accordance and a CI, 1.03-1.72]) and thiazide diuretics (HR, 1.56 [95% CI, 1.17-2.20]). In conclusion, this study found many patients with first-line β-blocker monotherapy for hypertension and no statistically significant differences in the effective for the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the statistical significant differences in the effective forms of the effective for safety comparing atenolol with third-generation β-blockers. Patients on third-generation β-blockers stroke than those on ACE inhibitors and thiazide diuretics.

Abstract

Background and Objective: As a response to the ongoing COVID-19 pandemic, several prediction models have been rapidly developed, with the aim of providing evidence-based guidance. However, no COVID-19 prediction model in the existing literature has been found to be reliable. Models are commonly assessed to have a risk of bias, often due to insufficing reporting, use of non-representative data, and lack of large-scale external validation paper, we present the Observational Health Data Sciences and Informatics (OHDSI) pipeline for patient-level prediction as a standardized approach for rapid yet reliable development and validation of prediction models. We demonstrate how our analytics pipeline.

Congratulations to the team of Akihiko Nishimura, Junqing Xie, Kristin Kostka, Talita Duarte-Salles, Sergio Fernández Bertolín, María Aragón, Clair Blacketer, Azza Shoaibi, Scott DuVall, Kristine Lynch, Michael Matheny, Thomas Falconer, Daniel Morales, Mitchell Conover, Seng Chan You, Nicole Pratt, James Weaver, Anthony Sena, Martijn Schuemie, Jenna Reps, Christian Reich, Peter Rijnbeek, Patrick Ryan, George Hripcsak, Daniel Prieto-Alhambra, and Marc Suchard for this preprint recently posted on MedRxiv: Alpha-1 blockers and susceptibility to COVID-19 in benign prostate hyperplasia patients: an international cohort study.

Abstract

Alpha-1 blockers, often used to treat benign prostate hyperplasia (BPH), have been hypothesized to prevent COVID-19 complications by minimising cytokine storms release. We conducted a prevalent-user active-comparator cohort study to assess association between alpha-1 blocker use and risks of three COVID-19 outcomes: diagnosis, hospitalization, and hospitalization requiring intensive services. Our study included 2.6 and 0.46 million to alpha-1 blockers and of alternative BPH therapy during the period between Novembland January 2020, found in electronic health records from Spain (SIDIAP) and the Unit States (Department of Veterans Affairs, Columbia University Irving Medical Center, IQVIA)

CDM Brainstorm Session March 30

The CDM workgroup has scheduled a special two-hour planning session for CDM 5.4 today at 1 pm in the CDM Teams environment, Clair Blacketer has shared a proposed list of changes.

Please join for some or all of the meeting if you are interested in helping shape the next update of the OMOP CDM.

KR1: List of Changes

Tuesday, March 16, 2021 10:25 AM

Start with v5.3 -> v5.4?

Easy Additions

- PROCEDURE OCCURRENCE
 - PROCEDURE STATUS CONCEPT ID
 - Similar to CONDITION_STATUS_CONCEPT_ID #376 maybe
- LOCATION CONCEPT ID
 - Make the location table international #365
 - Do we also need REGION_CONCEPT_ID and COUNTRY_CONCEPT_ID or is that subsumed by
- UDI field in DEVICE EXPOSURE
 - Make 250 characters to allow all permutations of UDI technically just a DDL change
- UNIT CONCEPT ID in DEVICE EXPOSURE #264
- UNIT_SOURCE_CONCEPT_ID in MEASUREMENT #259
- Representation of infusion rates is this solved with DOSE UNIT SOURCE VALUE? #224
- Add METADATA ID and VALUE AS NUMBER to METADATA #202
- Add VALUE_SOURCE_VALUE to OBSERVATION #193
- Change CDM_VERSION in CDM_SOURCE to numeric and use a concept_id #306
 - Also *technically* breaking but really a DDL change
- Add DEATH DATE alongside the DEATH table?
 - Add DEATH_TYPE_CONCEPT_ID to PERSON
- EPISODE and EPISODE EVENT

Potentials

- Rename VISIT_DETAIL_PARENT_ID to PARENT_VISIT_DETAIL_ID #329
 - This is *technically* breaking but I don't believe any standard processes currently reference
- GENDER CONCEPT ID
 - Changing this to SEX_CONCEPT_ID would be a breaking change. Should we add it instead and keep both fields?
- PROCEDURE END DATETIME #286
 - Agree, convention that if no end datetime then set to start datetime
 - o This would necessitate the addition of procedure_start_datetime or renaming of procedure date
 - Instead, add length of procedure to get around the breaking change
