

Best practices for prognostic model development using observational health data: a scoping review

Cynthia Yang

PhD Student at Erasmus MC

Erasmus MC
University Medical Center Rotterdam

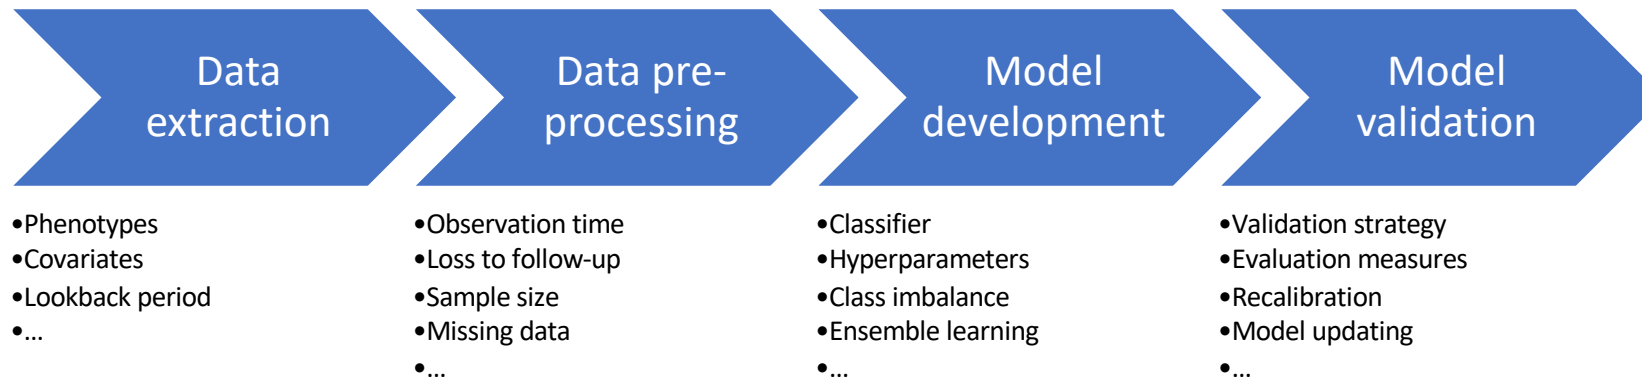

Prognostic model development

- Among a **target population** of patients at an index date ($t = 0$), predict which patients will experience some **outcome** during a **time-at-risk** period.

Study design choices

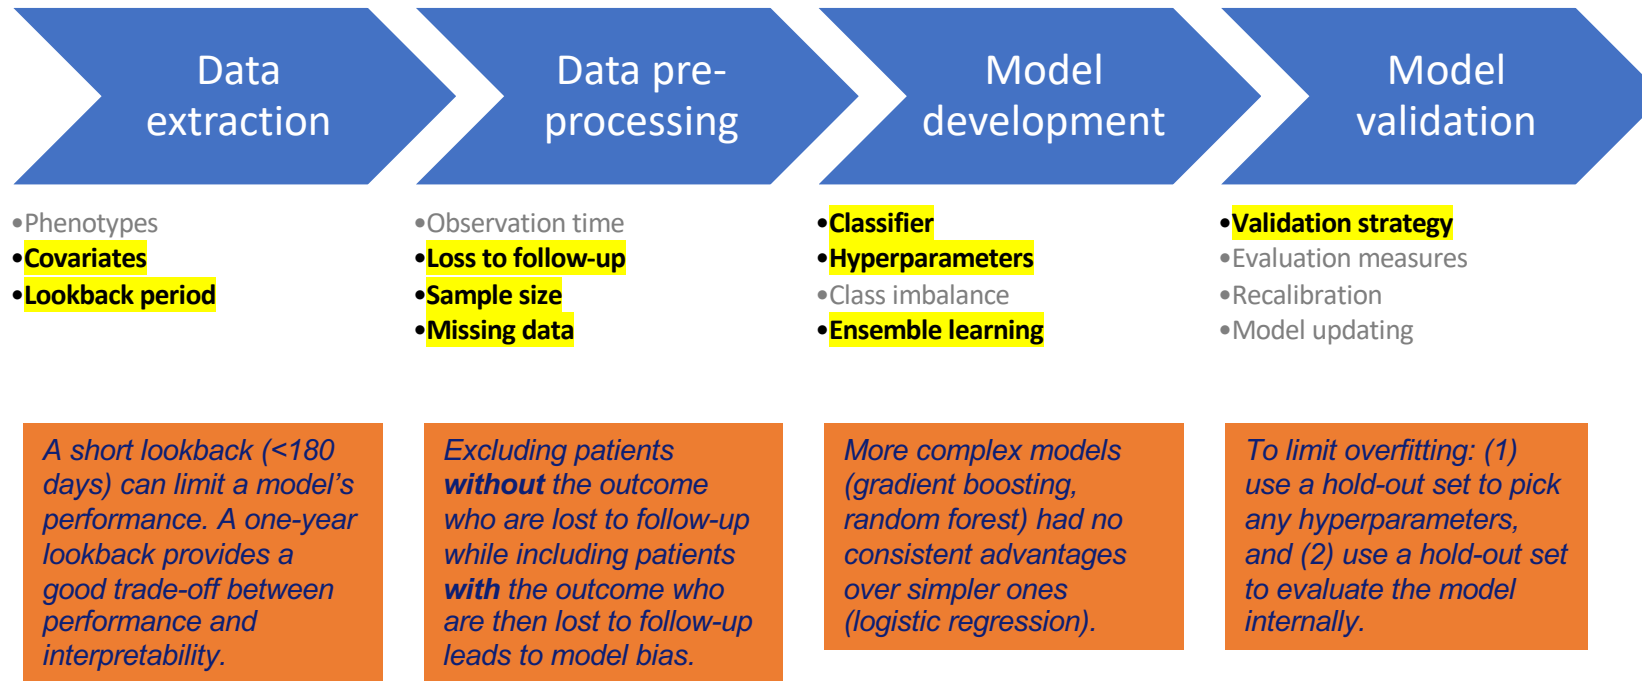

- Four study design components of prognostic model development:

Scoping review

- Aim: to present an overview of current knowledge and **empirical evidence**.
- Preliminary PubMed search for empirical studies.
 1. 6,671 titles inspected of studies from January 2018 to June 2022.
 2. 36 potentially relevant studies, 11 papers selected.
 3. Data extraction: study design component, recommendations for best practices, whether the OMOP CDM was used, and classifier.

Preliminary results

Preliminary results

- 6 out of 11 studies used OMOP CDM data.
- 3 out of 11 studies used MIMIC-III data.
- 2 out of 11 studies used other data.

- 5 out of 11 studies only used logistic regression.
- 6 out of 11 studies also used other classifiers.

MIMIC-III data → OMOP CDM data?

Logistic regression → Other classifiers?

Conclusions

- Model development should follow learned best practices.
- A lot of study design choices still require more research.
- Next steps: improve search strategy, more empirical research!
