

Phenotype evaluation

Patrick Ryan

With thanks to US faculty: Gowtham Rao, MD, PhD

Agenda – 50 minutes

Success: students can

Know how to recognize the presence of misclassification errors in the phenotype

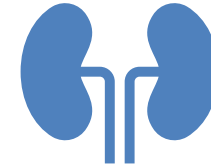

Errors and how they causes bias to the study results.

How would you fix them

Theory (10 min)

What is measurement error
Phenotype evaluation workflow

Examples (40 min)

See one: Acute Myocardial Infarction (20 min)

Do one: Angioedema (20 min)

Theory - Misclassification errors

What are misclassification errors

- Sensitivity errors
- Specificity errors
- Index date misclassification errors

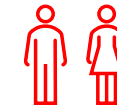

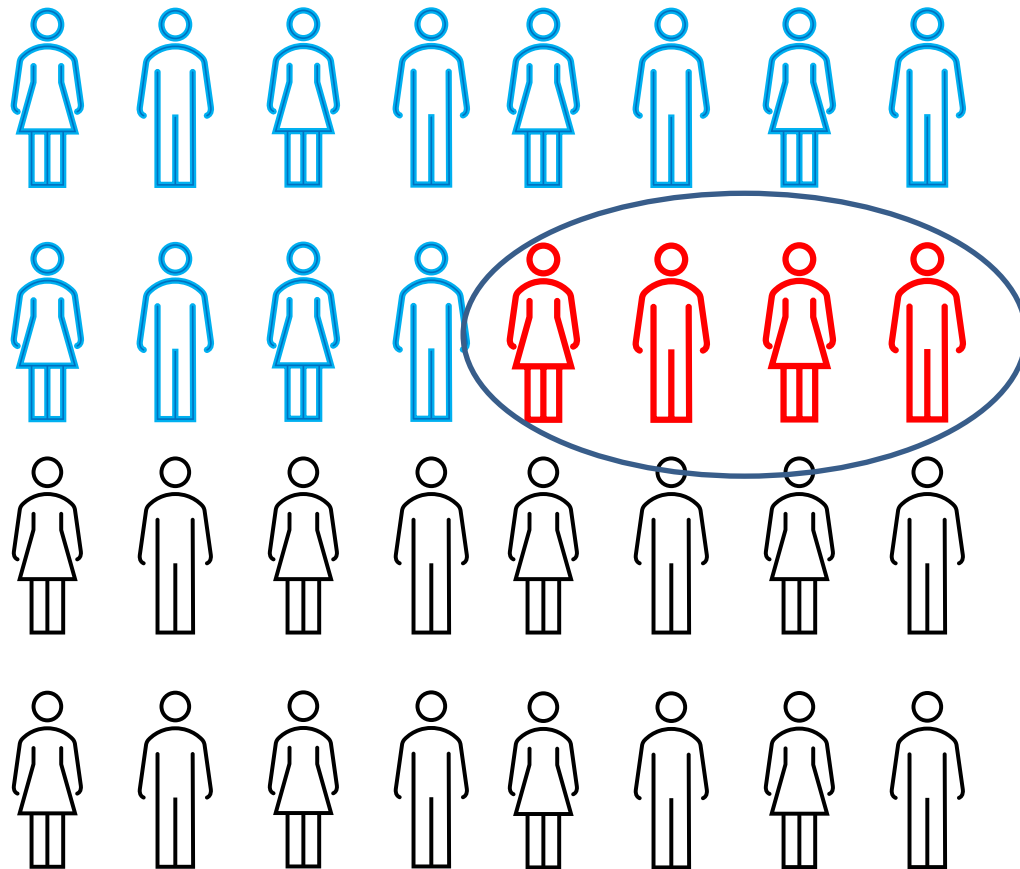

Validating phenotypes

- Phenotype algorithms are a translation of the health condition case definition needed to allow querying databases
- Inherent error in this translation → misclassification → measurement error
- Determine extent of misclassification
- Estimate:
 - Sensitivity – True positives and false negatives - proportion of cases that were included in the algorithm
 - Specificity – True negatives and false positives - proportion of non-cases that were included in the algorithm
 - Positive predictive value – True positives and false positives – proportion of the cases as defined by the algorithm that were actually true cases
- Correction of measurement error

Theory - Sensitivity Error

Persons in data source that have the phenotype of interest but were not identified

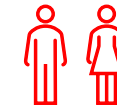

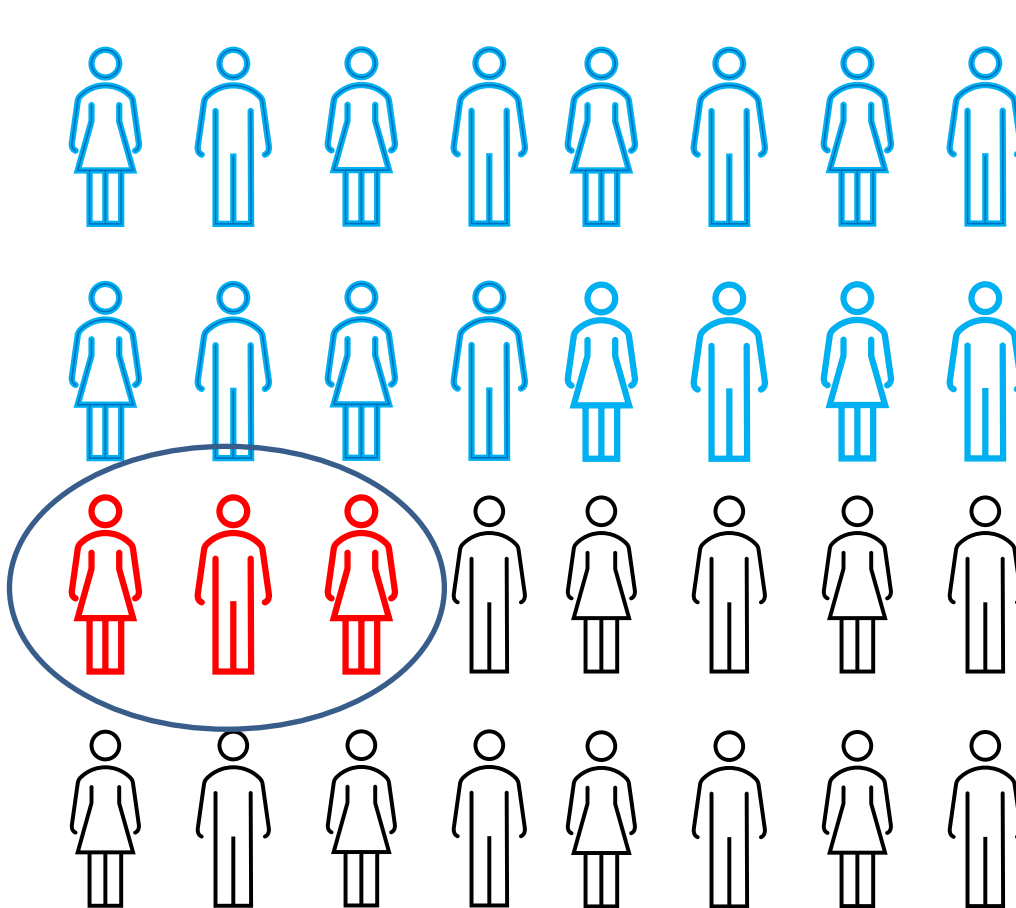

Persons in data source that were identified by the algorithm

We may say that a given cohort definition has **sensitivity errors**, if we *observe evidence* that there are persons in the data source who may have the phenotype of interest but are not in the cohort.

Theory - Specificity Error

Persons in data source that do not have the phenotype of interest but were not identified

Persons in data source that were identified by the algorithm

We may say that a given cohort definition has **specificity errors**, if we *observe evidence* that subjects in the Cohort do not have the phenotype of interest.

Theory - Index-date misclassification

We may say that a given cohort definition has index-date misclassification error, if we *observe evidence* that subjects identified in the cohort have incorrect designation of event start date.

Process - Phenotype development and evaluation

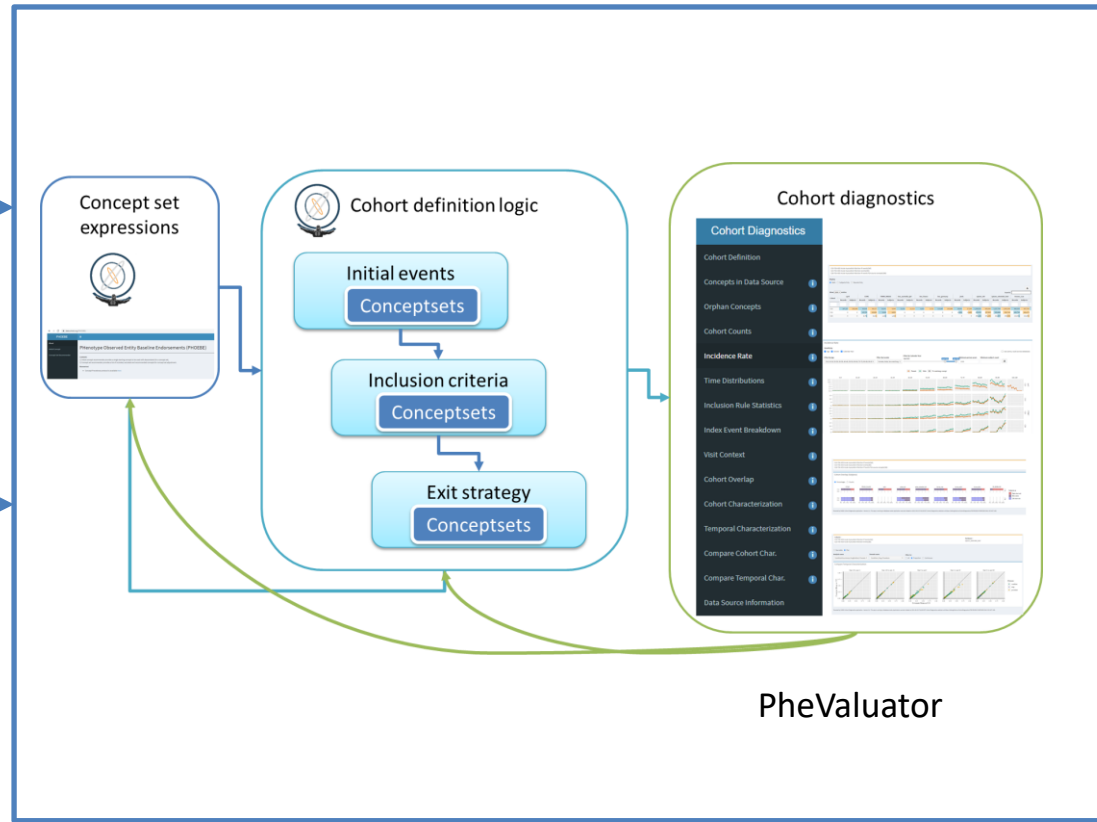

Required Inputs:

Clinical description

Prior knowledge from literature or other sources

Expected Outputs:

{Cohort definition(s)}

Evaluation report

Acute Myocardial Infarction (20 min)

- Clinical Description - identify
 - Strengtheners: signs, symptoms, diagnostic evaluation, treatments
 - Disqualifiers: mutually exclusive/cannot be present at the same time

Overview, Presentation, Diagnostic Evaluation, Therapy Plan, Prognosis

Acute new event ✓

Presentation: New onset severe angina (more than usual).

Diagnostic Evaluation: EKG changes

Therapy Plan: nitroglycerin, ASA, anticoagulants, beta blockers, Hospitalize, biomarkers (troponins).

Reperfusion therapy – PCI/CABG

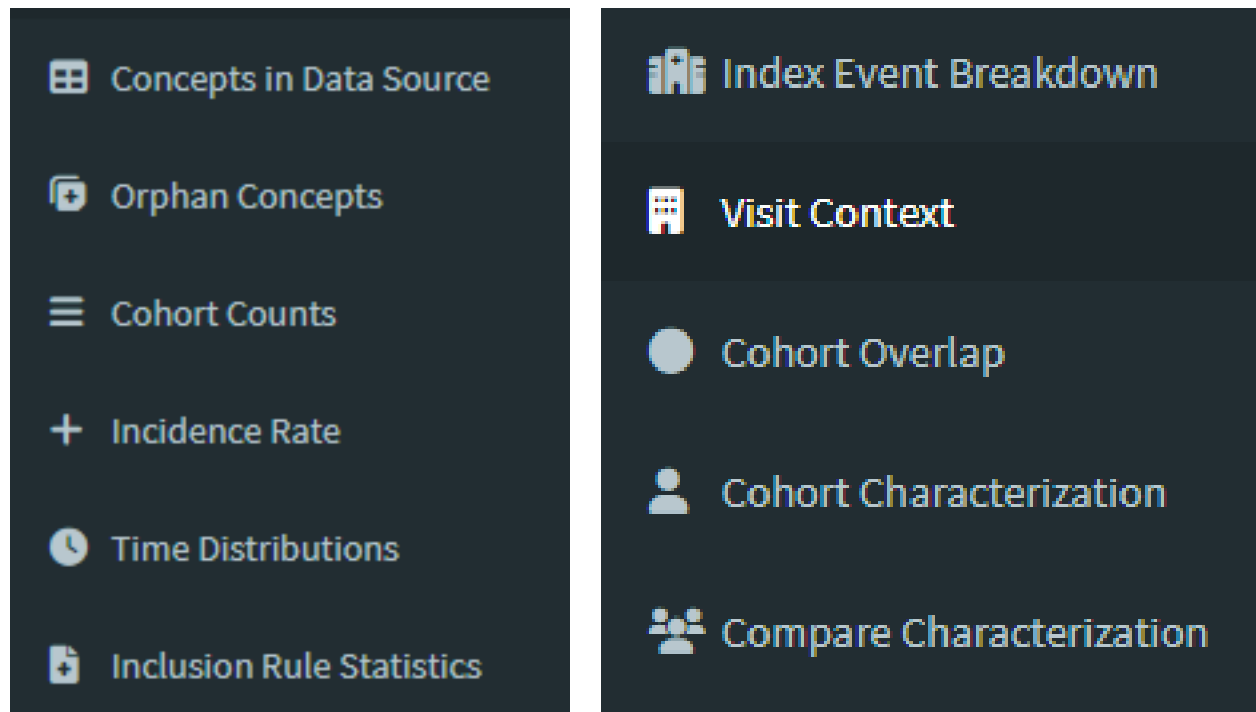

Prognosis: variable – 1 to 3 days. May re-occur.

Tool – Cohort Diagnostics

<https://data.ohdsi.org/Ohdsi22CdTutorialMyocardialInfarction/>

- Explore descriptive statistics on the cohort from data source
- Set of diagnostics (We'll use a subset in this workshop)

Cohort Diagnostics – Cohort Count

Cohort Diagnostics – Cohort Characterization

What to look for	Time frame	Variable (for MI)	Type of error
Do we observe concepts (events) that reflect known risk factors or co-existing conditions of the outcome	-365 to -1 -365 to 0	Hypertension, Diabetes mellitus, Hyperlipidemia, tobacco/nicotine, Coronary atherosclerosis	Sensitivity (Strengtheners)
Do you observe concepts (events) that reflect expected symptoms, signs, diagnostic workup, therapeutic/treatments or complications for the outcome (e.g., proportions of common treatments, known diagnostic procedures)	-30 to +30	Chest pain, critical care, ambulance, EKG, cardiac enzymes/troponin, catheterization, echo Aspirin, clopidogrel, nitroglycerin, Shock, cardiac failure, arrhythmia	Specificity (Strengtheners)
Do you observe concepts (events) that shouldn't be seen but are, concepts that may suggest presence of disease that may invalidate the phenotype? (e.g., mutually exclusive condition, differential diagnosis)	-30 to +30	Pleuritic pneumonia, aortic rupture, Cardiac transplant Historical Myocardial Infarction	Specificity (disqualifiers)
Do you observe concepts in the time prior that suggest outcome started earlier (e.g., Specific treatment, cooccurring conditions, specific diagnostic work, a complication or an exacerbation of the condition)?	-365 to -30	Like above	Index-Date Misclassification
Are cohort characteristics for the same PAs when observed over multiple data source similar or different?	-30 to +30		Specificity Sensitivity

Angioedema

Overview: Angioedema is self-limited, localized subcutaneous (or submucosal) swelling, which results from extravasation of fluid into interstitial tissues.

Presentation: Angioedema may occur in isolation, accompanied by urticaria, or as a component of anaphylaxis. Angioedema typically affects areas with loose connective tissue, such as the face, lips, mouth, and throat, larynx, uvula, extremities, and genitalia. Maybe rapid or slow in onset, may be life threatening if involves the larynx, airways, Bowel wall angioedema presents as colicky abdominal pain.

Assessment: Clinical diagnosis, testing is of limited use. ACE inhibitor exposure, hereditary or acquired C1 inhibitor deficiency. May have no identifiable cause. May re occur. If airway involved and life threatening, may need intubation. Else observation. Manage anaphylaxis if present.

Plan: Monitor, find and eliminate the etiology. Maintain airway – need for intubation

Disqualifiers: Cardiac edema (within 7 days), cellulitis (within 7 days), erysipelas (within 7 days), dermatitis (within 7 days), lymphedema (within 7 days), preceding insect sting (within 24 hours), preceding allergic reaction to food (within 24 hours)

Cohort Diagnostics – Cohort Characterization

What to look for	Time frame	Variable (for Angioedema)	Type of error
Do we observe concepts (events) that reflect known risk factors or co-existing conditions of the outcome	-365 to -1 -365 to 0	Allergies	Sensitivity (Strengtheners)
Do you observe concepts (events) that reflect expected symptoms, signs, diagnostic workup, therapeutic/treatments or complications for the outcome (e.g., proportions of common treatments, known diagnostic procedures)	-30 to +30	Swelling, itching, edema	Specificity (Strengtheners)
Do you observe concepts (events) that shouldn't be seen but are, concepts that may suggest presence of disease that may invalidate the phenotype? (e.g., mutually exclusive condition, differential diagnosis)	-30 to +30		Specificity (disqualifiers)
Do you observe concepts in the time prior that suggest outcome started earlier (e.g., Specific treatment, cooccurring conditions, specific diagnostic work, a complication or an exacerbation of the condition)?	-365 to -30	Epinephrine	Index-Date Misclassification
Are cohort characteristics for the same PAs when observed over multiple data source similar or different?	-30 to +30		Specificity Sensitivity
