Multinational Uptake of Cardioprotective Antidiabetic Drugs

bmjmedicine
Visual abstract

Second line antihyperglycaemic drug
initiation across cardiovascular risk groups

Summary

Despite the increase in overall uptake of cardioprotective antihyperglycaemic drugs as second line treatment for type 2 diabetes, their uptake was lower in patients with cardiovascular disease (CVD) over the past decade

9

Countries

18

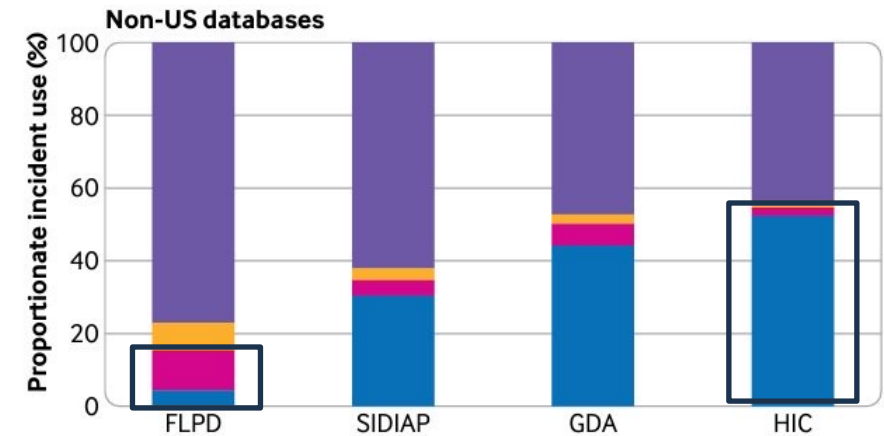

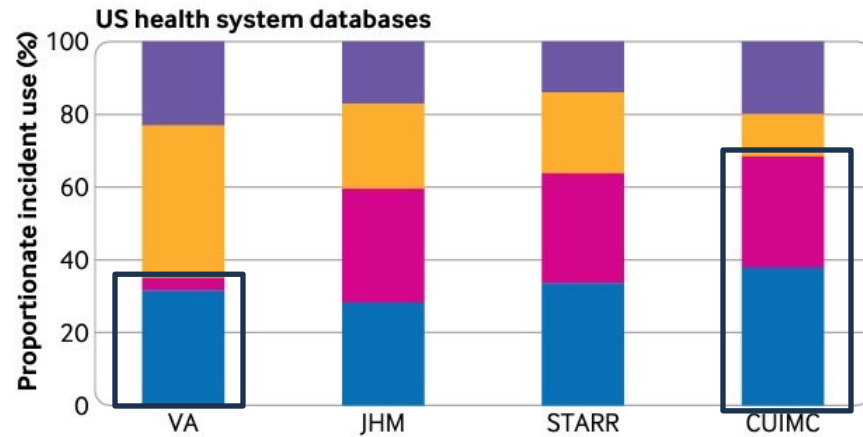

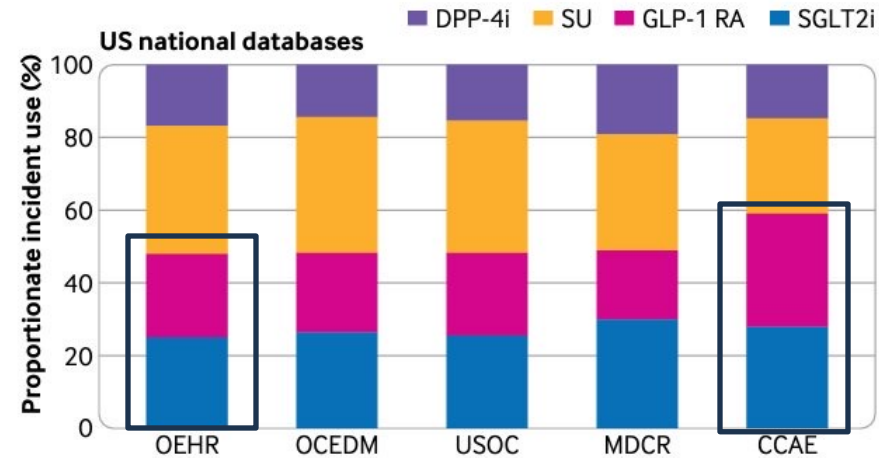

Administrative claims &
EHR databases (2011-2021)

18

Million Participants

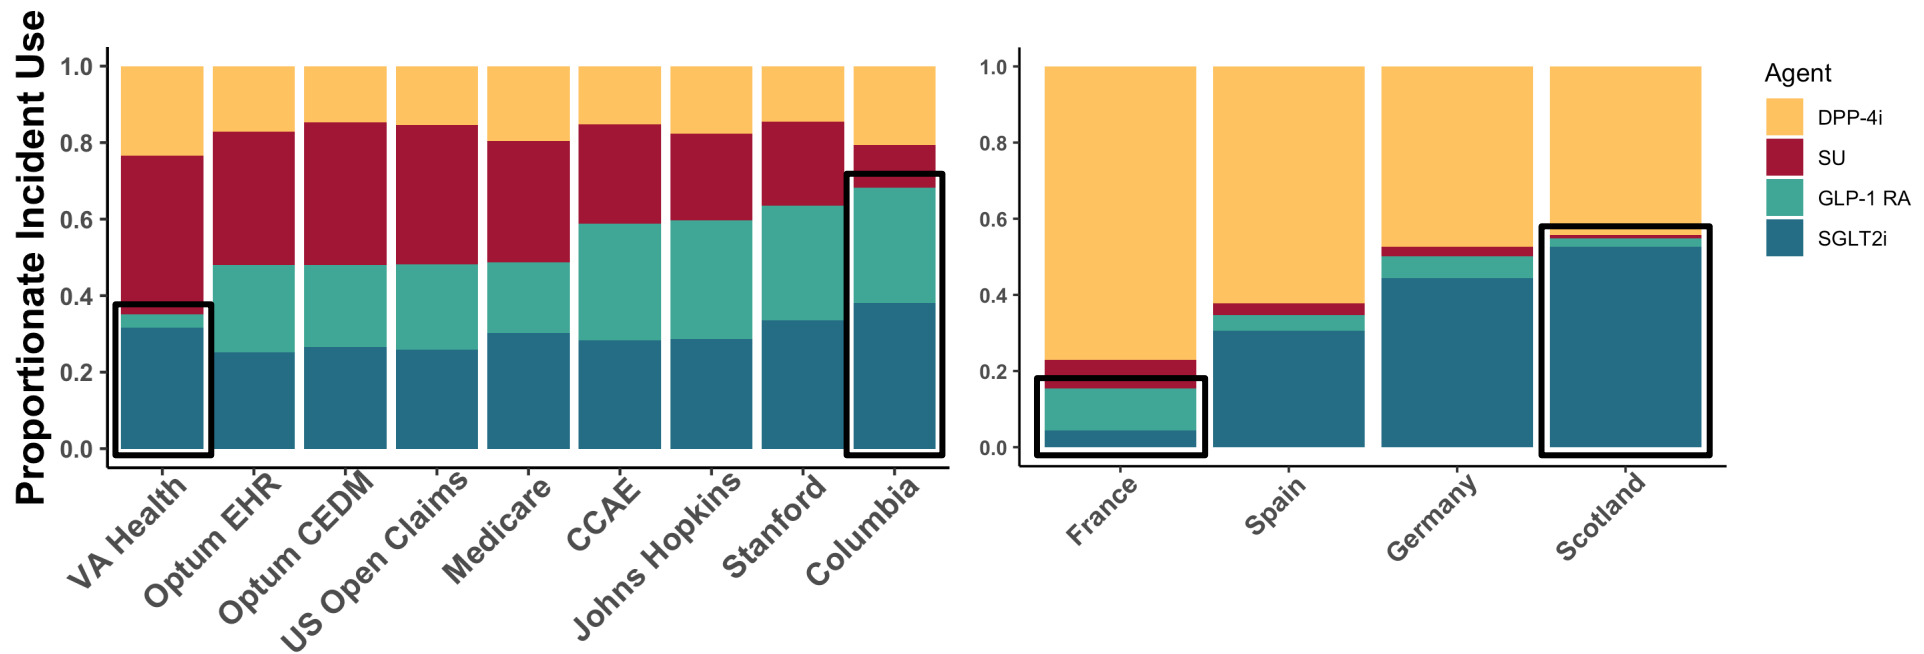

Proportional use of second line agents

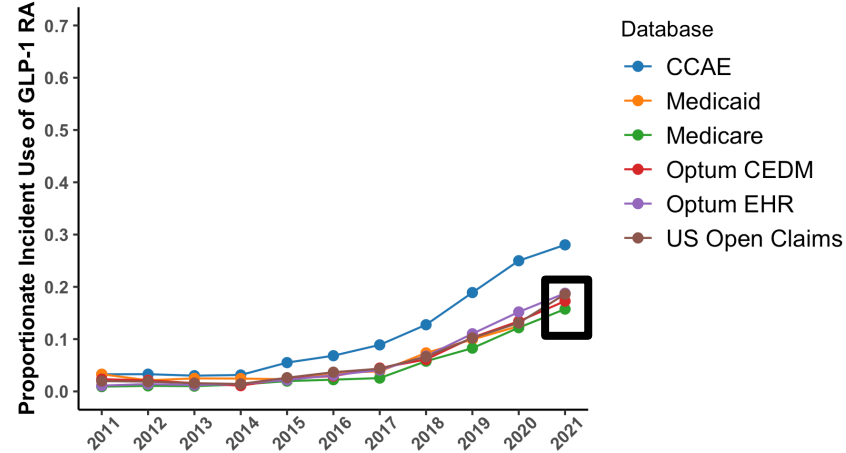

Proportionate Incident Use of Second-line Anti-hyperglycemic Agents in 2021

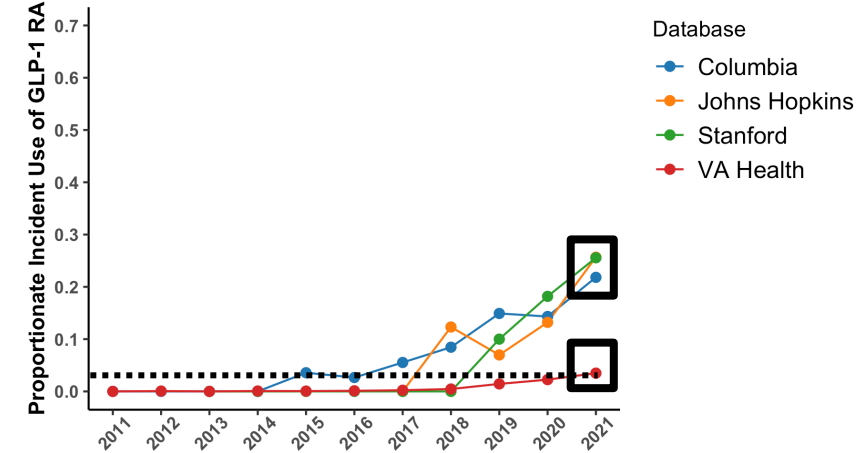

GLP-1 RA Uptake in Patients with Established CVD

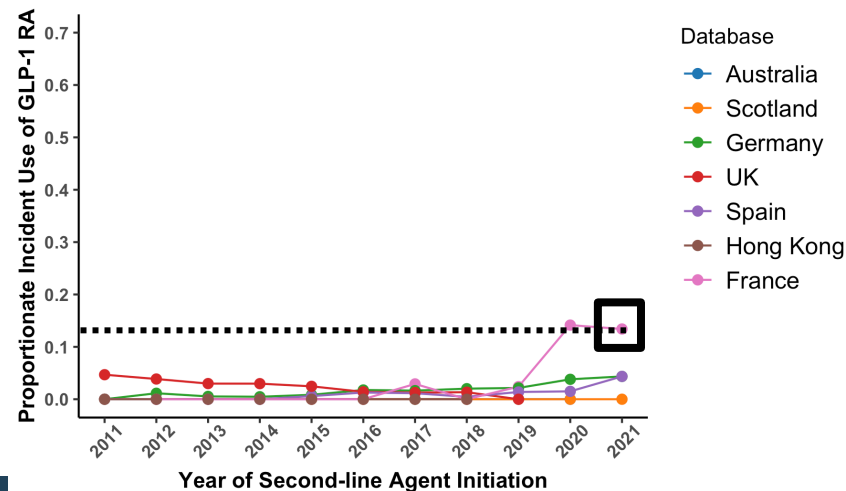

US National Databases

US Health System Databases

Non-US Databases

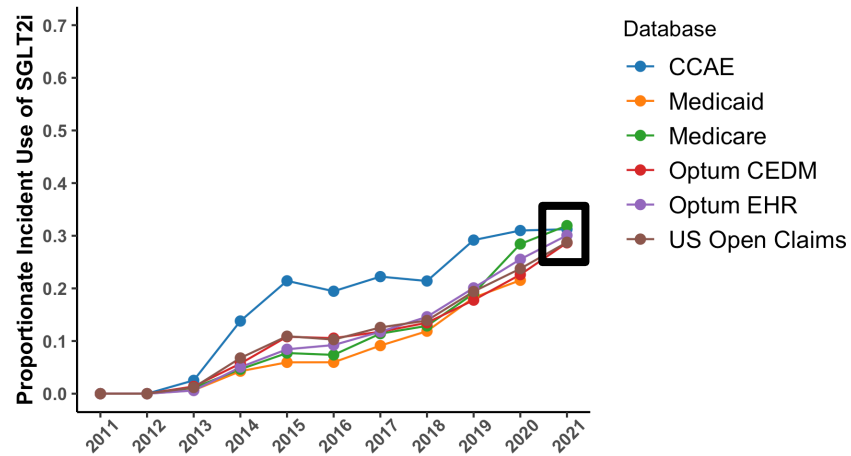

- Initiation of GLP-1 RAs increased to 20-25% across most US populations
- Initiation was <5% in the VA
- Initiation was low across non-US databases, reaching a maximum of 14% in France in 2021

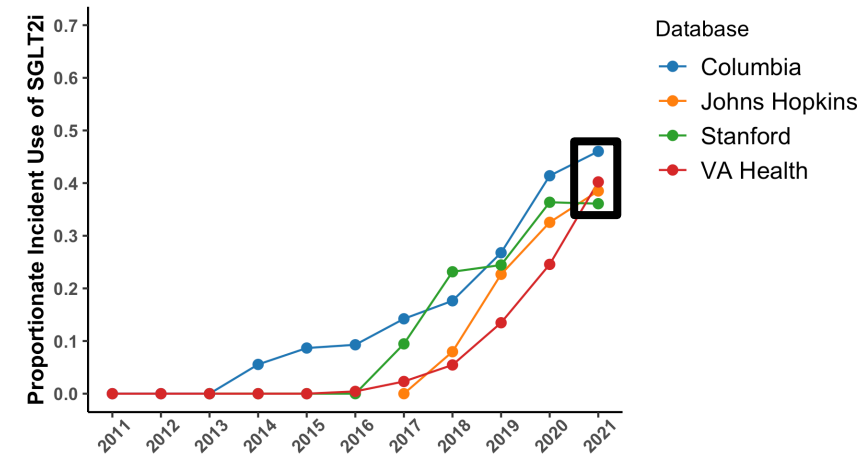

SGLT2i Uptake in Patients with Established CVD

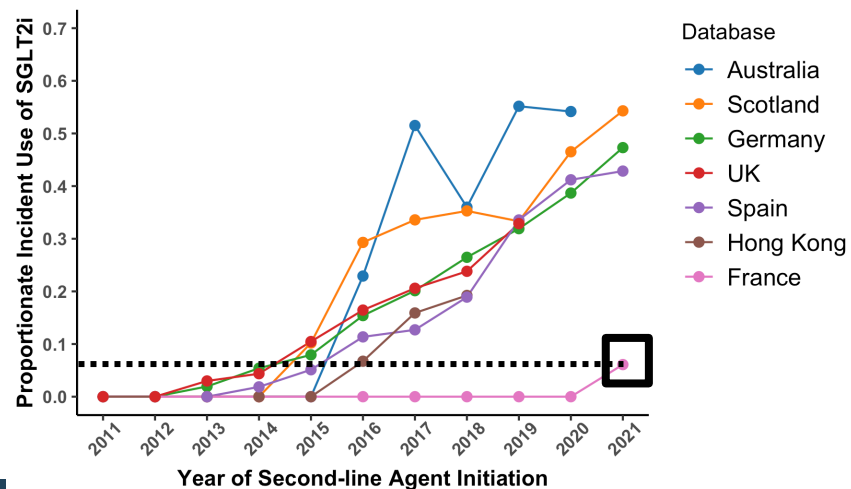

US National Databases

US Health System Databases

Non-US Databases

- Initiation of SGLT2is increased to ~35% across US populations
- In the non-US databases, the initiation of SGLT2is was higher in most databases, reaching up to 54% in Scotland in 2021
- In France, the initiation was lower, reaching only to 6% in 2021

DPP4is	↓	US < NUS	—
SUs	↓	US > NUS	—

Proportionate Incident Use of 2nd line AHT as 1st line over time

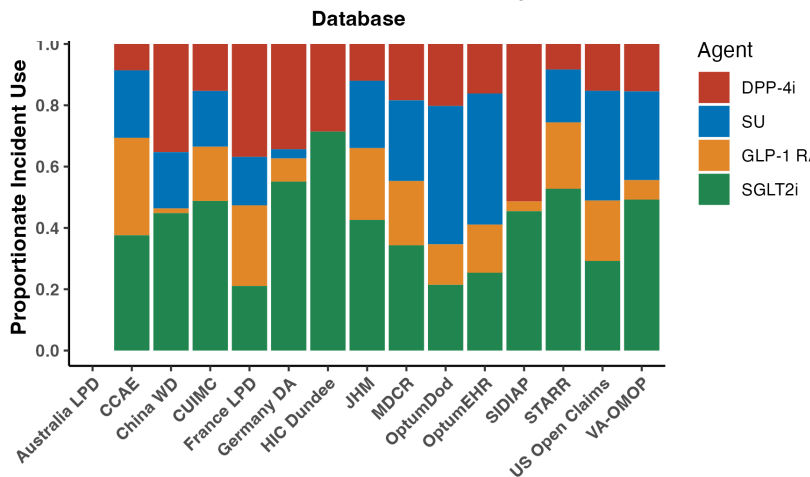

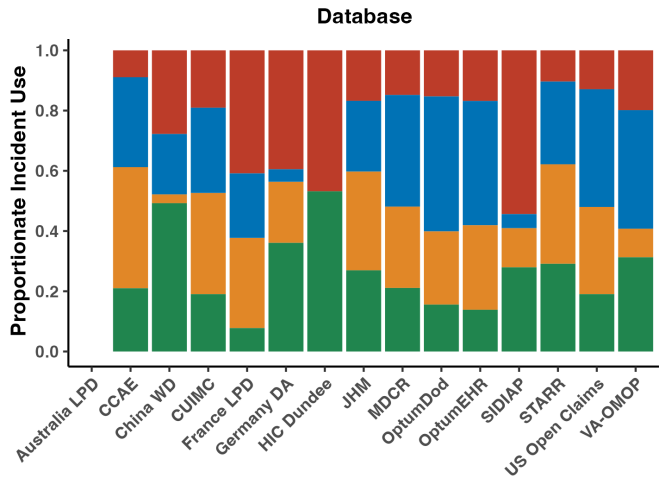

2018

By CV Risk

AHT	Time	CVD	CVD x Time
SGLTis	↑	NCVD > CVD	NCVD < CVD
GLP1RAs	↑	—	NCVD > CVD
DPP4is	↓	—	—
SUs	↓	—	—

2021

CV Risk

Proportionate Incident Use of 2nd line AHT over time

By Database Region and as 1st Line vs 2nd Line

AHT	Time	US	2 nd Line	US x Time	US x 2 nd Line	2 nd Line x Time	US x 2 nd Line x Time
SGLTis	↑	—	—	US<NUS	—	1 st >2 nd	↓
GLP1RAs	↑	US<NUS	—	US>NUS	US>NUS	1 st >2 nd	↓
DPP4is	↓	US<NUS	1 st >2 nd	US>NUS	US>NUS	2 nd >1 st	↑
SUs	↓	US>NUS	1 st >2 nd	US<NUS	US<NUS	2 nd >1 st	↑

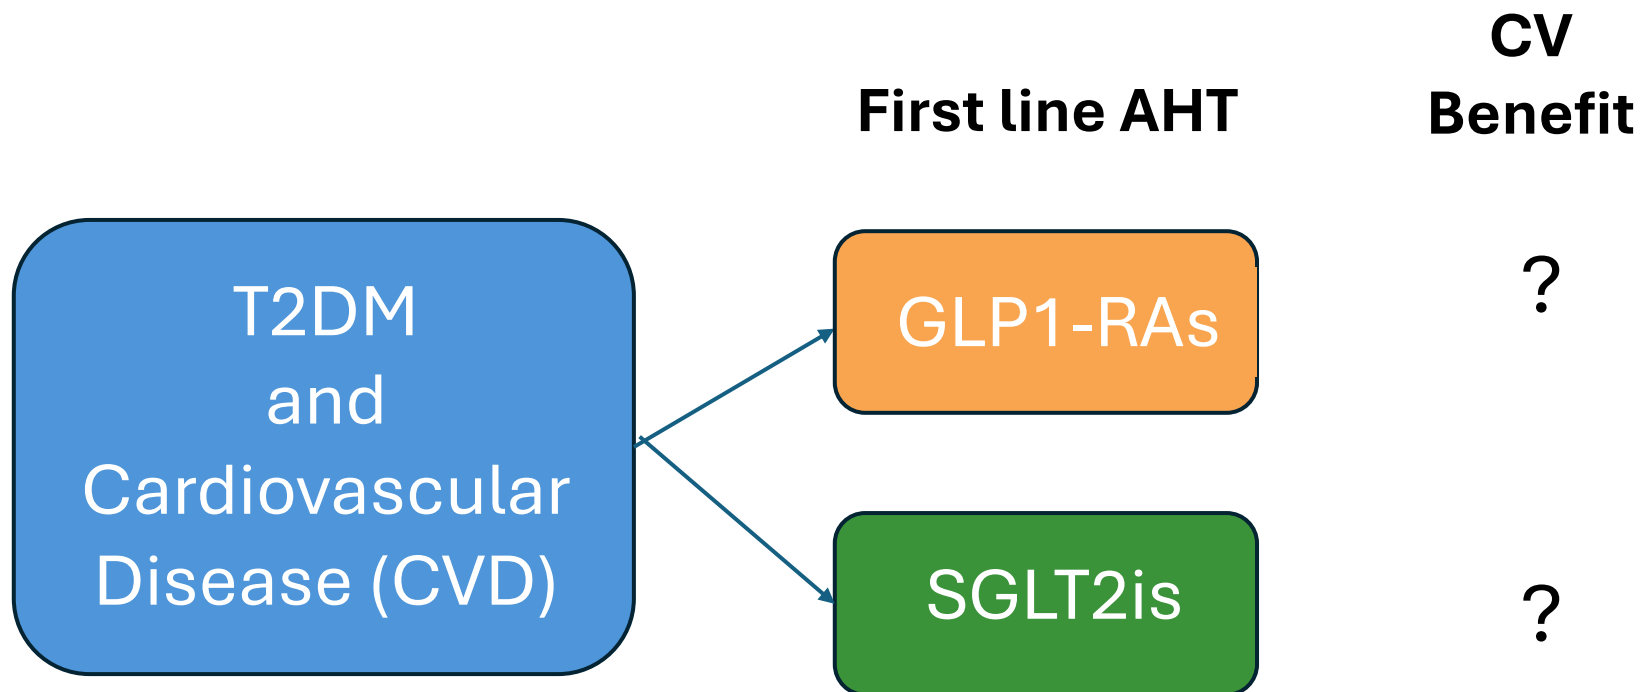

Conclusions

- Cardioprotective AHT have increased as 1st line over time.
- The rate of increase of SGLTis as 1st line AHT has been greater in non-US databases, while for GLP1RAs, the opposite is true.
- The rate of increase of SGLTis as 1st line AHT has been greater in patients with CVD, while for GLP1RAs, the opposite is true .

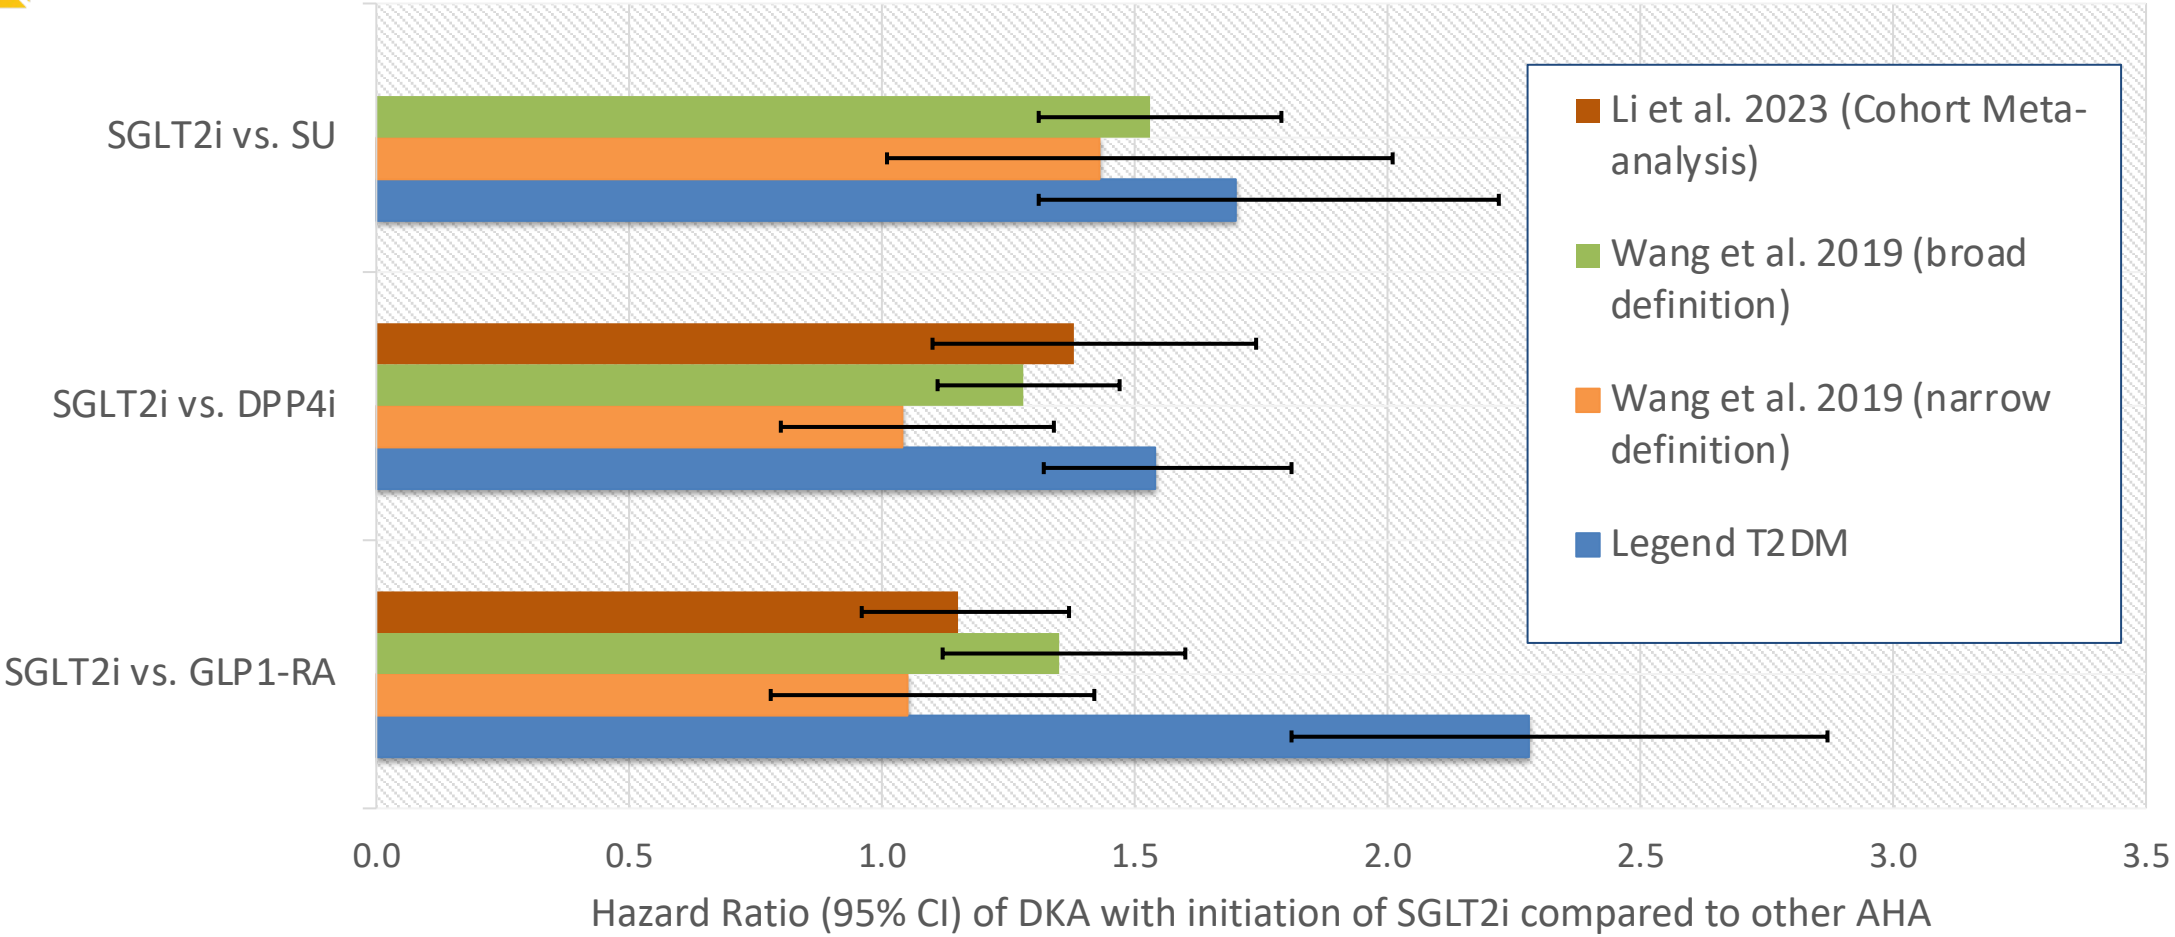

Figure 5. Relative Risk of DKA outcome in users of SGLT2i compared with other Anti-Hyperglycemics

Conclusion

- Findings suggest an increased risk for DKA in new users of SGLT2i compared to other 2nd line agents.
- Clinical emphasis on patient education around sick day management and recognizing DKA signs/symptoms.

GLP-1 Receptor Agonists and Thyroid Tumor:

A study of new users of GLP1-RA as second line therapy in Type 2 Diabetes Mellitus

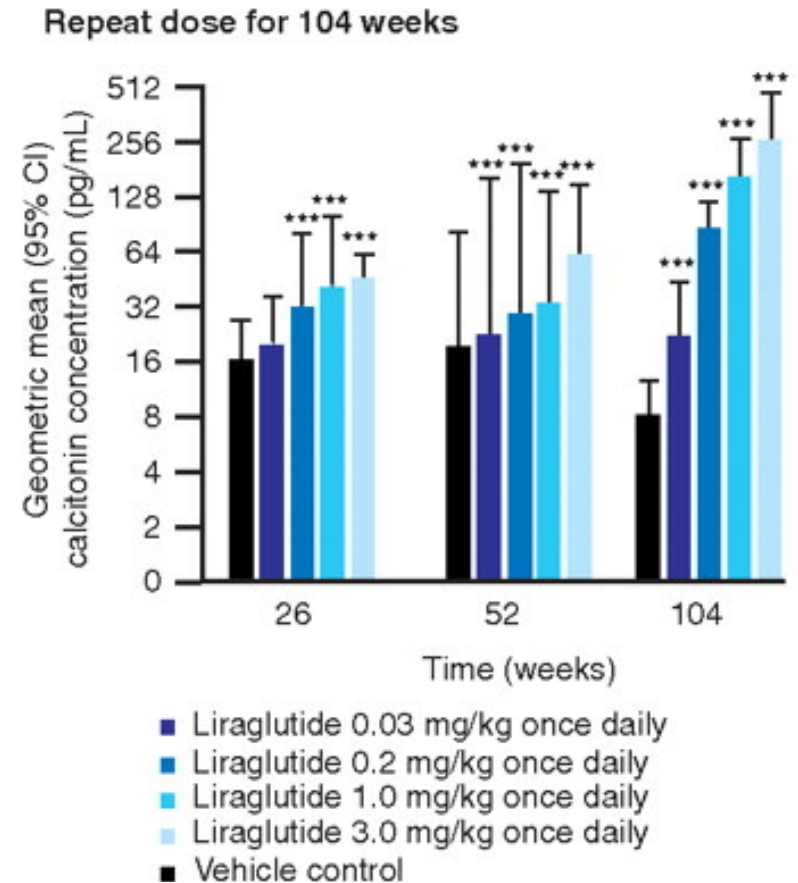

Background on GLP1-RA & thyroid tumor

Non-clinical studies suggest GLP-1 RAs have effects on the thyroid gland, potentially involving the development of thyroid cancers, particularly medullary thyroid cancer (MTC).

In rodents

- Activation of the GLP-1 receptor on thyroid C-cells leads to calcitonin secretion
- Plasma calcitonin is a specific biomarker for increased C-cell number & changes in calcitonin levels are used in the diagnosis of C-cell disease in humans

MTC is an important potential risk in the risk minimization plan (RMP for GLP-1 RAs and monitored in an ongoing PASS.

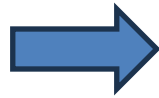

Background on GLP1-RA & thyroid tumor

TRULICITY (dulaglutide) injection, for subcutaneous use
Initial U.S. Approval: 2014

WARNING: RISK OF THYROID C-CELL TUMORS

See *full prescribing information for complete boxed warning*.

- Dulaglutide causes thyroid C-cell tumors in rats. It is unknown whether TRULICITY causes thyroid C-cell tumors, including medullary thyroid carcinoma (MTC), in humans as the human relevance of dulaglutide-induced rodent thyroid C-cell tumors has not been determined (5.1, 13.1).
- TRULICITY is contraindicated in patients with a personal or family history of MTC and in patients with Multiple Endocrine Neoplasia syndrome type 2 (MEN 2). Counsel patients regarding the potential risk of MTC and symptoms of thyroid tumors (4, 5.1).

FDA

CONTRAINDICATIONS

- Patients with a personal or family history of medullary thyroid carcinoma or in patients with Multiple Endocrine Neoplasia syndrome type 2 (4, 5.1).
- Patients with a prior serious hypersensitivity reaction to TRULICITY or any of the product components (4, 5.4).

WARNINGS AND PRECAUTIONS

- *Thyroid C-cell Tumors:* See Boxed Warning (5.1).

5.3 Preclinical safety data

Non-clinical data reveal no special hazards for humans based on conventional studies of safety pharmacology or repeat-dose toxicity.

In a 6 month carcinogenicity study in transgenic mice, there was no tumorigenic response. In a 2 year carcinogenicity study in rats, at ≥ 3 times the human clinical exposure following 4.5 mg dulaglutide per week, dulaglutide caused statistically significant, dose-related increases in the incidence of thyroid C-cell tumours (adenomas and carcinomas combined). The clinical relevance of these findings is currently unknown.

EMA

No warnings or
modifications for use

GLP1-RA & thyroid tumor signal assessment

European study published assessing risk of MTC with GLP1-RA leading to EMA signal.

The study included a high proportion of the French population using a case control design.

The adjusted analysis showed that **use of GLP-1 agonists for 1-3 years** was associated with increased risk of **thyroid cancer (HR 1.58; 1.27–1.95)**, and **MTC (HR 1.78; 1.04–3.05)**.

GLP-1 receptor agonists and the risk of thyroid cancer

Bezin J., Gouverneur A., Pénichon M., Mathieu C., Garrel R., Hillaire-Buys D., Pariente A., Faillie J-L.

Nationwide population-based study on French SNDS database

3,746,672 individuals with type 2 diabetes treated with second-line antidiabetes drugs between 2006-2018

2,562 cases of thyroid cancers

New user active comparator federated cohort study comparing GLP1-RA with DPP4I, SU, SGLT2 as second line T2DM therapy.

Different databases, different countries, standardised approach with meta-analysis.

Bea et al. 2023 (South Korea) cohort study. GLP-1RAs was not associated with an increased risk of thyroid cancer (weighted HR 0.98, 95% confidence interval 0.62-1.53) compared with that of SGLT2 inhibitors.

GLP1-RA and thyroid tumor

Meeting highlights from the Pharmacovigilance Risk Assessment Committee (PRAC) 23-26 October 2023

27 October 2023

[News](#) [Human](#) [Pharmacovigilance](#) [Referrals](#)

GLP-1 receptor agonists: available evidence not supporting link with thyroid cancer

EMA's safety committee (PRAC) has concluded that the available evidence does not support a causal association between the Glucagon-Like Peptide-1 Receptor Agonists (GLP-1) - exenatide, liraglutide, dulaglutide, semaglutide, and lixisenatide - and cancer of the thyroid (a small gland in the front and lower part of the neck which makes and releases hormones).

New user activation line T2DM therapy as second

Different databases, different countries, standardised approach with meta-analysis.

Bea et al. 2023 (South Korea) cohort study. GLP-1RAs was not associated with an increased risk of thyroid cancer (weighted HR 0.98, 95% confidence interval 0.62-1.53) compared with that of SGLT2 inhibitors.

What did we learn?

- Thyroid tumor is rare
- Only US databases contributed to the meta-analysis
- **Generalisability & sample size**
